

Bi-Weekly Progress Report (Periodic Report)

Directly evaluates CLO 1.1 (Diagnose issues) and CLO 1.2 (Labor-market comparison).

Part A: Administrative & Professionalism (CLO 3.1)

Student name	Yazeed Mohammed Elnour
Report Number	#1
Period Covered	From: 07/06/2026 To: 18/06/2026
Hours Logged	60
Attendance & Punctuality Status:	[] Excellent [] Good [] Needs Improvement

Part B: Application of IT Skills (CLO 2.1)

- List the specific tasks executed, IT tools utilized, and systems analyzed during this period.*

During this reporting period, I actively participated in gathering and analyzing the business requirements for the company's ERP system, with a specific focus on the Human Resources (HR) department. A major task I executed was analyzing the "End of Service" (Offboarding) process. To translate these complex business procedures into clear technical specifications, I utilized Mermaid (a markdown-inspired diagramming tool) to design detailed workflow diagrams. By creating these workflow designs, I was able to visually map out the exact sequence of steps, system interactions, and necessary approvals required when an employee's service is terminated. This ensured that the development team has a precise and structured blueprint to follow.

- Part C: Diagnosing Technical Issues (CLO 1.1 & 3.2)**

Describe a technical issue you encountered. How did you apply theory/concepts from your academic studies (e.g., IT Governance, Project Management) to diagnose and propose a solution?

A main challenge I encountered was the communication gap during the requirement-gathering phase. The HR team understands their business processes perfectly, but it was difficult for them to express their needs from a technical perspective. To solve this, I applied concepts from my Systems Analysis and Requirements Engineering courses. I acted as a bridge, asking them specific questions about their daily workflows and then translating those business needs into clear technical specifications for the development team.

Part D: Labor-Market Comparison (CLO 1.2)

Compare the practices, tools, or workflows you observed at the company during these two weeks with the industry standards you learned academically. What were the gaps or differences?

The workflows I observed align closely with what I learned in my Software Engineering courses. The company practically applies the standard Software Development Life Cycle (SDLC). Just like we learned academically, they strictly follow a structured approach: we start by collecting and analyzing data, move into the design phase, and only then proceed to develop the solution. Seeing this process applied in a real business environment confirmed the practical value of what we studied.
